WICO MAGNETOS      DEPENDABLE IGNITION

*Wico Electric Company*  
WEST SPRINGFIELD, MASSACHUSETTS

The Wico magneto is an important and vital part of your Wisconsin engine. Its function is to generate high tension electricity to produce the spark at the spark plug. The magneto has a built-in impulse coupling mechanism that enables it to furnish a hot, fat spark at cranking speed. This makes starting very easy.

Wico magnetos are made from quality materials and are constructed by skilled workmen. Each magneto is individually inspected and test-run before leaving the factory and is fully guaranteed as explained in the warranty on page 3.

This booklet has been prepared so that accurate servicing information will be available to the user. **Do not attempt to make any repairs to the magneto other than those outlined in this booklet.** Major repairs should be taken to the nearest authorized Wico Service Station, as shown in pages 6 thru 8. All parts should also be ordered from the nearest Service Station, **not** from the Wico Electric Company nor from the Wisconsin Motor Corp.

## WICO WARRANTY

We warrant each piece of apparatus manufactured by us to be free from defects in material and workmanship under normal use and service. Our obligation under this warranty is limited to the furnishing of any part of said apparatus which shall within a period of ninety (90) days after delivery to the original consumer, be returned to one of our authorized service stations, or to one of our authorized Distributors, or to the factory, transportation charges prepaid, and which, upon examination by one of our authorized representatives, shall disclose to our satisfaction to have been thus defective.

Any magneto or other piece of apparatus shall not be considered to have been under nor-

mal use and service if it appears to have been subjected to misuse, abuse, neglect or accident, or if it has been repaired or altered outside of our factory so as, in our judgment, to affect its stability or reliability, or if any part not of Wico manufacture has been substituted for a part of Wico manufacture.

This warranty is in lieu of all other warranties, either expressed or implied, and we do not authorize any person or persons to assume for us any other liability in connection with the sale of our equipment; nor are we responsible for any liability for any damage or injury to any person or part resulting directly or indirectly from design, material, workmanship or installation of any of our apparatus.

## WARRANTY ADJUSTMENT PROCEDURE

Apparatus assumed to come within the terms of the warranty should be submitted to the nearest authorized Wico Distributor or Wico Service Station with a formal request for adjustment.

If upon examination by such an authorized representative the apparatus is found actually defective and within the warranty period, he will place it in proper operating condition and no charge made either for labor or material. The term labor does not refer to that involving the removing or installing the apparatus, nor for transportation, duty or tax thereon, but only refers to the actual bench labor on the apparatus itself. Any labor charge other than for such bench labor, is to be borne by the owner, who will be required to sign a warranty Service Report form at the time a warranty adjustment is made. If the Service Station or Distributor sends a properly filled out warranty Service Report form to the Company, and if in the case of a Service Station a copy thereof is sent to the Distributor, and if the parts returned are tagged with the Company's tag, and if examination of the returned material and claim by the Company indicates that in the opinion of the Company, which shall be final, the claim comes within the warranty, the Company will make such adjust-

ment for the Distributor either by the giving of credit or by replacing the defective apparatus covered by the warranty, and the Distributor shall in turn forward such adjustment to his Service Station or customer. All adjustments shall be made in accordance with the regulations of the Company made from time to time.

When the Service Station or Distributor is in doubt as to the cause of the apparatus being inoperative, the owner should pay the Service Station or Distributor for the material and labor charges, who will forward the units or parts claimed defective to the Company, together with a signed warranty Service Report form. Upon receipt and examination by the Company of the units or parts and the warranty Service Report form, the claim will be carefully considered and if in the opinion of the Company, which shall be final, the units or parts are found to have been defective, credit will be issued to the Distributor for both labor and material and the Distributor will reimburse the Service Station, who will reimburse the owner the amount paid for material and labor. If apparatus is submitted directly by the Service Station to the Company a copy of the warranty Service Report forms should be furnished to the Distributor by the Service Station.

**WICO ELECTRIC COMPANY**

WEST SPRINGFIELD, MASSACHUSETTS, U. S. A.

**WICO MODEL XH-I MAGNETO**

**Model XH 1295**

The parts in Spec. 1295 and 150C are the same except for the ground connection units.

AHH	

## TIMING

The magneto is properly timed to the engine at the factory. If it becomes necessary to retime the magneto to the engine, refer to the diagram and instructions in the engine instruction book.

## IMPORTANT

Incorrectly adjusted spark plug gaps cause magneto failure more frequently than any other condition.

Spark plugs should be inspected at frequent intervals, the size of the gap should be carefully checked and adjusted and the plugs thoroughly cleaned.

All oil, grease, and dirt should frequently be wiped off the magneto, lead wires, and spark plug insulators. Keeping these parts clean and the spark plugs properly adjusted will improve the engine performance and at the same time will prolong the life of the magneto.

## MAGNETO COVER

The magneto cover, X5640, can be removed by loosening the four screws, 5622, which hold it in place. When replacing the cover be sure that the cover gasket, 5618, is in its proper place.

## BREAKER CONTACTS—REPLACEMENT AND ADJUSTMENT

The breaker contacts should be adjusted to .015" when fully opened. To adjust the contacts, loosen the two clamp screws, 5900, enough so that the contact plate can be moved.

Insert the end of a small screw driver in the adjusting slot and open or close the contacts by moving the plate until the opening is .015", measuring with a feeler gauge of that thickness, tighten the two clamp screws.

To replace the contacts remove the breaker spring clamp screw, 6017, the breaker arm lock and washer, 3219, and 4210, then lift the breaker arm from its pivot. Remove the aligning washer, 5717, and the two fixed contact clamp screws, 5900. The breaker plate can then be removed.

If the contacts need replacing it is recommended that both the fixed contact and the breaker arm be replaced at the same time, using replacement breaker set X5996.

After assembly the contacts should be adjusted as described above. The contacts should be kept clean at all times. Lacquer thinner is an ideal cleaner for this purpose. Use WICO tool S-5449, to adjust the alignment of the contacts so that both surfaces meet squarely.

## CONDENSER

To remove the condenser, X5614, first disconnect the condenser lead by removing the breaker arm spring screw, 6017, then remove the two condenser clamp screws, 5411, and the condenser clamp 5532. When replacing the condenser make sure it is properly placed and that the clamp screws are securely tightened.

## COIL AND COIL CORE

The coil and coil core must be removed from the magneto housing as a unit. Disconnect the primary wire from the breaker arm spring terminal by removing screw, 6017, take out the two coil core clamp screws, 5411, and remove the clamps 5633. The coil and core can then be pulled from the housing. When replacing this group make sure that the bare primary wire is connected under the core clamp screw and that the insulated wire is connected to the breaker arm spring terminal.

## REMOVAL OF COIL FROM CORE

The coil X5700, is held tight on the core, X5524, by two wedges, 10383. It will be necessary to press against the coil core with considerable force to remove it from the coil. The coil should be supported in such a way that there is no danger of the primary of the coil being pushed out of the secondary.

When replacing the coil on the coil core, slide it on then press in the two coil wedges, one on each end, until they are flush with the primary of the coil.
